

1. (a)

(a) If the cannonball is fired at a 45° degree angle.

$$\begin{aligned} v_y &= \frac{v}{\sqrt{2}} \\ v_x &= \frac{v}{\sqrt{2}} \end{aligned}$$

$$\begin{cases} \text{in the } x \text{ direction, } x = v_x t \\ \text{in the } y \text{ direction, } y = v_y t - \frac{1}{2} g t^2 \end{cases} \Rightarrow y = x - \frac{1}{2} g \left(\frac{x}{v_x} \right)^2 = x - \frac{g x^2}{2 v_x^2}$$

$$y = x - \frac{g x^2}{v^2}$$

so. when $x = 150 \text{ m}$

$$y = 12.2 \text{ m} < h = 15 \text{ m}$$

It cannot make the cannonball over the wall.

(b) If the cannonball is fired at a θ angle

in the x direction, $x = v \cos \theta t$

$$\begin{aligned} \text{in the } y \text{ direction, } y &= v \sin \theta t - \frac{1}{2} g t^2 = v \sin \theta \frac{x}{v \cos \theta} - \frac{1}{2} g \frac{x^2}{v^2 \cos^2 \theta} \\ &= x \tan \theta - \frac{g x^2}{2 v^2 \cos^2 \theta} \end{aligned}$$

if we want the ball over the wall, $y \geq 15 \text{ m}$ (when $x = 150 \text{ m}$)

$$h_{\max} = 12.73 \text{ m}$$

So it's impossible to make the ball over the wall.
